INTRODUCTION

Energy consumption per capita in Arizona has been 16 per cent below the national average /1/. However, the rate at which total energy usage in the state has been growing is about twice that of the nation and most other states in the Rocky Mountain and Pacific regions. Also, the share of total energy devoted to the transportation sector in Arizona is more than 30 per cent above the national average /2/.

Transportation energy demand in Arizona, among other factors, is a function of residential population, population inflow (employment and non-employment migrants), tourism, the economy, winter weather conditions in the State and other parts of the nation, and availability of motor fuels.

In the recent past the nation has faced two fuel shortages. Arizona, being a non-petroleum producer, and therefore, being totally dependent on the flow of energy into the state, has had to bear more than its share of supply shortfall. In order to be able to understand the petroleum demand trends in Arizona better and to help develop measures that can be useful in lessening the impact of existing and possible future shortages, a set of data on past motor fuel sales and potential future fuel needs for each county has been assembled. In order to introduce this material a brief narrative summarizing important trends follows.

PAST FUEL DEMAND

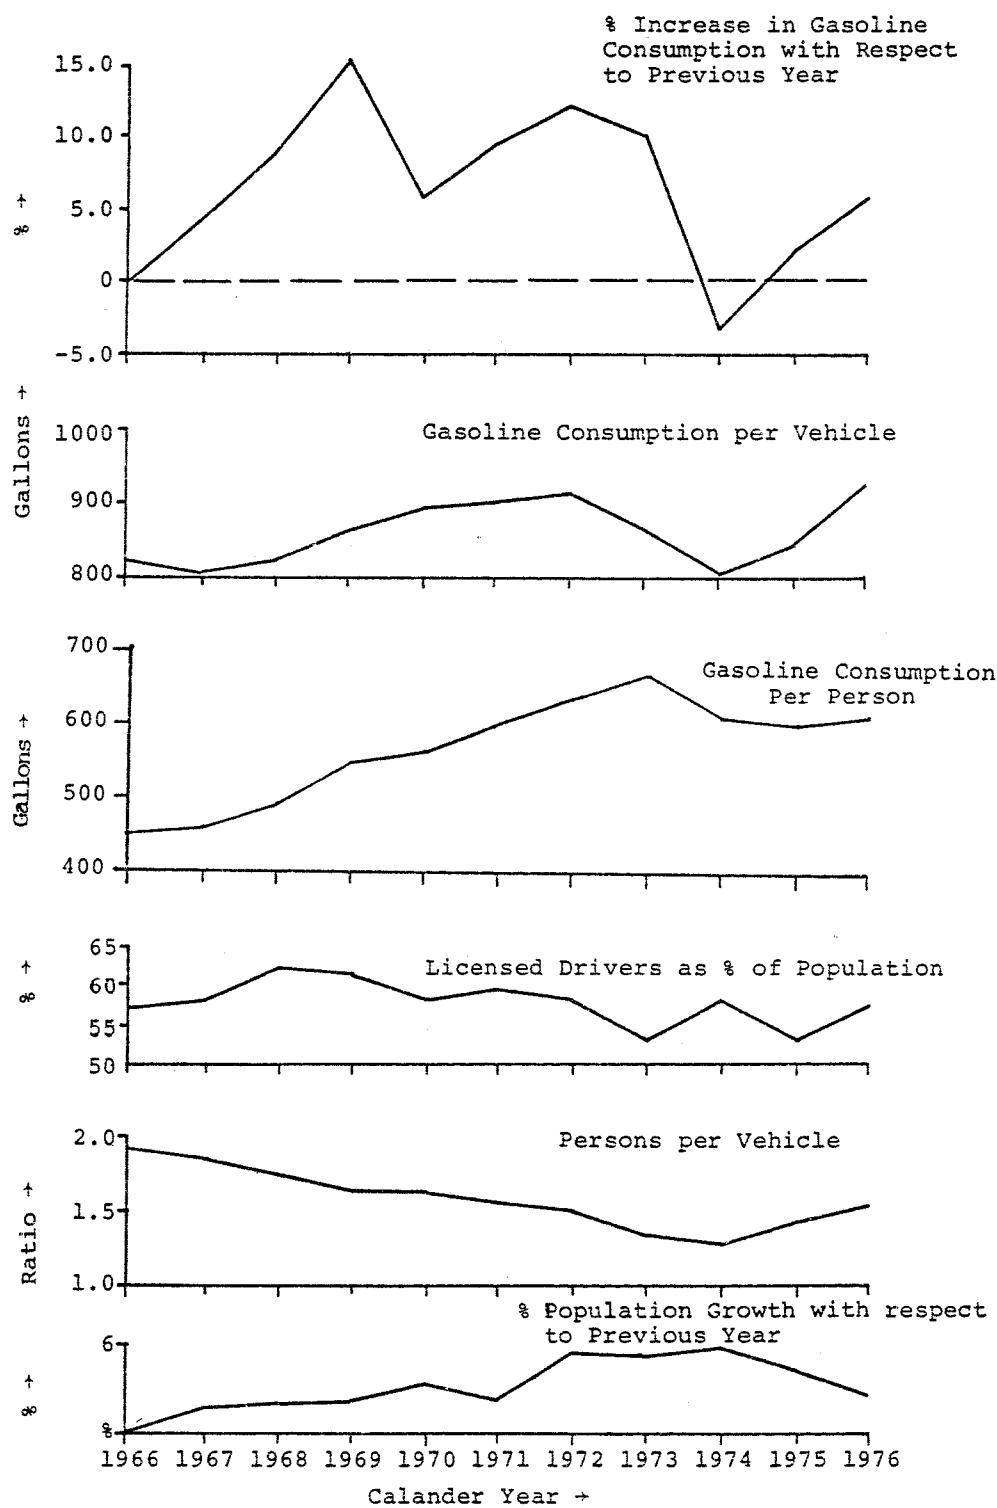

The total petroleum demand in Arizona increased at a rate of about 10 per cent per year between 1960 and 1973. Due to 1973-74 oil embargo, fuel usage declined until 1975; however, usage has increased rapidly since that time /2/. On a statewide basis, total gasoline demand for transportation increased by about 12 per cent between 1975 and 1978. Total diesel demand for transportation, alone, increased by over 22 per cent during this period. In comparison, nationally total petroleum demand in transportation increased by about 8 per cent between 1975 and 1977.

In spite of increasing fuel prices in 1978, total gasoline and diesel usage in the transportation sector have increased by 5.5 and 6.6 per cent, respectively, in Arizona. This increase in fuel usage is largely due to continued growth in Arizona's economy and population. Illustration 1 depicts gasoline consumption trends in Arizona between 1966 and 1976.

The average consumption of motor fuel by month and the daily seasonal usage in Arizona are significantly different from that of the national average, as shown in Illustration 2. The seasonal variation in this state is almost flat, peaking slightly during the summer. Monthly usage peaks during winter as well as in summer; the later peak being about 9 per cent higher than that of the winter. The nature

of this fuel consumption distribution is a reflection of the influx of out-of-state tourists during the winter, in addition to vacation activities during the summer.

A county-level analysis of past motor fuel usage suggests that the seasonal demand fluctuations can play a significant role in future transportation fuel demand. Gasoline and diesel demand between 1975 and 1978 has been plotted for each county in Appendix I. It is clear from these graphs that gasoline demand in various counties peaks at different times of the year. On the other hand, such a peak for diesel demand is not so obvious in most of the counties. Also, the 1978 fuel demand in most cases, is considerably higher than previous years. Santa Cruz County, however, had a significant drop in annual demand for gasoline. Other counties, which also had ups and downs in usage during the last four years are Gila, Greenlee, Mohave, Pinal and Yavapai.

It is also interesting to note from these graphs that the impact of fuel shortages and high costs of the 1973-74 oil embargo were still fresh in 1975 and 1976. Also, the consumers' reaction to sudden increase in oil supplies due to availability of Alaskan oil and drop in retail fuel price (in constant dollars), is also notable in these plots.

FUTURE FUEL DEMAND

The main purpose of the statistical analysis of past data is to provide a basis for projecting future demand.

Because of limited time and data on other variables, the forecasting approach was simplified by assuming that annual fuel demand can be taken as a quantitative dependant variable of time. Thus, a time series model was developed for each county in Arizona, using motor fuel consumption data for the period 1975-76. It should, however, be noted that models so developed only define the demand trend. In order to obtain monthly demand estimates, cyclic and seasonal fluctuations of monthly demand were calculated as an average share of the demand realized over the past years. This over-simplified time series model developed for each county was then used to predict the demand. The resulting motor fuel demand forecasts for 1979 and 1980 are shown in Appendix III for each county. The aggregate gasoline and diesel demand for the State obtained by this method is shown in Illustration 3.

FUEL DISTRIBUTION

Transportation and distribution of motor fuel in Arizona have been discussed on a micro basis in other reports /2,3/. In addition, it is necessary to understand how transportation fuel is distributed in the State and who supplies it. In the final analysis, of course, the fuel distribution depends on demand patterns. Illustrations 4 and 5 show the distribution of gasoline by suppliers, by county to meet civilian demand.
